Data Scientist I - Data Science Consulting

Up to c £55K + Benefits
Reading and/or London – hybrid 3 days p/week onsite

The Opportunity
Our client, MarketCast, is hiring a Data Scientist for its Data Science Consulting team. The team answers hard questions for some of the biggest brands in the US. Its work goes straight into client decisions.

The data is rich and varied: surveys, TV viewership and card spend. Some projects use proven, standard solutions. Others are harder, such as linking ad performance to real business outcomes, where the signal is challenging to tease out. New datasets and vendors arrive often, so there is always something new to connect.

This is a chance to take ownership of projects, guide junior colleagues and work across many clients and problems. No one works alone here, and the work gets used. Learning is backed with time and support, including certifications.

They're looking for someone to:

- Explore and join survey, TV viewership and transactional data in Python and SQL on AWS
- Scope, plan and lead client projects
- Build supervised and unsupervised models: classification, regression, forecasting and segmentation
- Engineer features for client problems and build robust models free of leakage and overfitting
- Present methods and results to client insights and analytics leads
- Guide and support junior team members
- Create client reports and visuals in Streamlit and Python
- Maintain and improve the team's machine learning pipelines

What they're looking for:

- 2 to 4 years experience in data science, including managing projects independently
- Solid ML fundamentals: classification, regression, random forests, gradient boosting, evaluation metrics, cross-validation
- Proven proficiency in Python, SQL and pandas, including querying large datasets
- Strong communication: presenting results and explaining data science to non-technical people. Client work helps, but internal stakeholders count too
- Curiosity about the question behind the question
- Survey data or data engineering experience is a plus
- AWS or GenAI experience is a plus
- A degree in a quantitative subject such as Maths, Statistics, Physics, Psychology, Sociology, Economics, Engineering or Computer Science. A Master's or higher is a plus
- Eligibility to work in the UK without sponsorship

Their Purpose
MarketCast measures what moves people. It is the marketing effectiveness partner to most of the top US advertisers, including Netflix, Nike, Apple, Amazon, Disney+ and the NFL. Its team of over 300 researchers, technologists and data scientists works across 24 trillion data points, 40 million consumer responses and 60 billion ad impressions a year. Its flagship Brand Effect product is proven to predict real-world sales.
