RELEX Talent Acquisition Team

Re: Forecasting Product Engineer

Dear RELEX team,

I am drawn to forecasting work when the difficult part is not just producing a number, but building something people can trust and use again. At Li Auto, I worked with battery and after-sales teams to project battery-health trajectories, identify cohorts at risk of accelerated degradation and evaluate possible interventions. I also built reusable features across vehicle platforms and helped put a separate safety-ranking model into a monitored production workflow. Each step required understanding where the data could mislead us, and making the result useful to the people making the decision.

What interests me about RELEX is the challenge of making forecasting models both reusable and responsive to differences between real operating contexts. I have not worked on retail demand forecasting; my experience is in battery data and the internal teams who use those models. But I would bring hands-on experience in feature engineering, repeatable model delivery and explaining the assumptions behind an analysis. In an investigation product I built with AI coding assistance, I also learned to use these tools to speed up implementation while remaining accountable for what the software actually does. I would welcome the chance to apply that way of working to forecasting products used by RELEX's customers.

I am planning to relocate to the UK and would be glad to discuss my timing and work authorisation in relation to this role.

Kind regards,

Wentworth Liu
